

Fitting Instructions:

RD7894.01-X Oil Pressure Transmitter

Version 2.0 28/7/2022

RD7894.01-X is an upgraded oil pressure transmitter designed to replace previous aftermarket versions that would not operate until the oil pressure reached 7-12 p.s.i. Straight six engines often idle at a lower oil pressure, causing the gauge to read zero until engine revolutions increased sufficiently to operate the needle. RD7894.01-X is designed to work with the original gauge, mimicking the output curve exhibited by the transmitter fitted by the factory.

Please note:

some vehicles may have been retrofitted with a modified gauge and transmitter. In this case, replacing with transmitter RD7894.01-X will cause the gauge to read off the scale. In this case, contact your seller for further instructions.
